

A phase boundary is an information policy

It determines what evidence is kept, what options are dropped, and what later trials can learn from the earlier ones

How each design treats evidence at the phase boundary

Commit to one dose
Confirm both doses
Select one, then reuse evidence
Select one, then confirm evidence

* Conceptual illustration

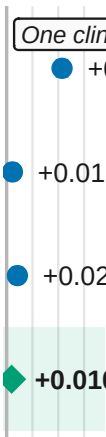

Confirm both doses
vs commit to one

Select one + fresh confirmation
vs commit to one

Select one + reuse evidence
vs commit to one

Reuse earlier evidence vs
require fresh confirmation

* Supported (prespecified c

Descriptive resource difference, not

DESCRIPTIVE
Reusing evidence across the boundary saves 2
and about 2.5 months versus a fresh-confirmation
scenario and this budget.
